

Retail Inventory Analysis Dashboard

ID Juicer is a health-focused retail company specializing in the sale of **sugar-free, fresh-from-the-source beverages**. We offer a diverse selection of premium healthy drinks, including cold-pressed juices, natural coconut water, and artisanal nut milk. Our mission is to seamlessly provide consumers with delicious, convenient products that support and promote a **healthy lifestyle**.

To ensure the "ID Juicer" narrative is financially sustainable, we analyze a real-time **Inventory Management Dashboard**. This dashboard visually tracks the critical metrics of **units sold**, **units spoiled (loss)**, and **inventory turnover rate**. It provides a detailed breakdown of these metrics across **individual stock-keeping units (SKUs)**, **major product categories**, and **logistical fulfillment channels**.

Inventory Analysis Dashboard

Inventory Analysis Dashboard

The **spoilage rate** across all product units exhibited a concerning **16.9% increase month-over-month (MoM)** in November 2025. Concurrently, the operational stability metrics confirmed **zero unit stockouts**, indicating efficient, albeit potentially excessive, safety stock management.

Inventory Analysis Dashboard

The November 2025 inventory analysis reveals significant red flags regarding efficiency and financial risk that demand immediate attention:

- **Inventory Turnover:** The efficiency of capital utilization has declined, evidenced by an Inventory Turnover of **34.46**, which represents a **6.4% decrease from the previous month**. This indicates that stock is moving through the system more slowly.
- **Inventory Value at Risk (IVaR):** The exposure to potential loss has increased, with the IVaR rising to **Rp.904M**, a 1.4% increase. This rise signals greater financial capital tied up in potentially unstable inventory.
- **Spoilage Value:** The most critical concern is the escalating cost of lost goods, with the Spoilage Value reaching **Rp.34M**, marking a highly significant **19.2% increase**.

Inventory Analysis Dashboard

The three-bar chart visually maps the distribution of **Spoilage Units**, **Spoilage Value**, and **Inventory at Risk Value** across individual products, revealing a key vulnerability in our inventory strategy:

- **Coconut Water (High-Volume, High-Loss):** Our best-selling product, **Coconut Water**, with the highest volume of **Units Sold**, simultaneously generates the greatest volume of **Spoilage Units** and the highest **Spoilage Value**. This classic "A-Item" scenario identifies Coconut Water as the highest priority for inventory control optimization.
- **Choco Blast (High-Value, High-Risk):** In contrast, **Choco Blast** contributes nearly as much to the total **Spoilage Value** as Coconut Water, despite having **less than half the spoiled units**. This disparity is directly attributed to its **unit cost being two times higher** than Coconut Water. Critically, Choco Blast registers the **highest Inventory at Risk Value at Rp.257M**, making it a primary financial concern.

Inventory Analysis Dashboard

The daily trend analysis for **Spoilage Units** reveals a highly irregular pattern in November 2025:

Initial Stability: Spoilage was effectively managed and performed well during the **first week** of the month.

Critical Spike: This stability was sharply broken by an **extreme and sudden increase** in spoiled units occurring specifically between **November 7th and 9th**.

Return to Normalcy: Following this three-day anomaly, the spoilage rates returned to typical, baseline levels for the end of the month.

Inventory Analysis Dashboard

The final metric details the distribution of **Spoilage Units** across our three major product categories, confirming that inventory loss is highly concentrated:

- **Freshy Coconut:** Accounts for the overwhelming majority of spoilage at **56.39%**. This category must be the **primary focus** for all immediate loss prevention efforts due to its disproportionate contribution to waste.
- **Juicy Juice:** Contributes **23.37%** of total spoilage.
- **Nut Milk:** Contributes **20.24%** of total spoilage.

Conclusion

The November 2025 inventory analysis shows a **systemic failure in control** due to rapidly escalating spoilage costs and decreasing efficiency, despite perfect fulfillment (zero stockouts).

Key Problems Identified

- **Major Financial Loss:** Spoilage value jumped by **19.2%**, leading to significant loss of the 34M total value at risk.
- **Concentrated Risk:** Over half of all unit spoilage (**56.39%**) stems from the **Freshy Coconut** category.
- **Temporal Anomaly:** The majority of losses occurred during a highly specific, three-day period: **November 7th – 9th**.

Dual Product Threat:

- **Coconut Water:** Highest volume, highest unit spoilage.
- **Choco Blast:** Highest cost-per-loss, nearly matching the spoilage value of Coconut Water with fewer units. Also have the **highest Inventory at Risk Value at Rp.257M**, making it a primary financial concern.

Recommended Immediate Action

- Initiate a focused Root Cause Analysis (RCA) to investigate operations and handling procedures specifically for the **Freshy Coconut** category during November 7th–9th.
 - Launch a strategic, short-term Volume Discount ('Buy More, Save More') or Product Bundle promotion specifically targeting the oldest **Choco Blast** batches to convert high-value inventory to revenue before expiration.
-
